

ROADGAS

Transitioning fleets towards greener operations

Nottingham-based Roadgas, the UK's leading supplier of natural gas and biomethane refuelling station infrastructure and all related equipment, is powering the transition for large and small fleet operators to help reduce their carbon footprint and enjoy long-term savings on fuel costs.

Working with both local authorities as well as large and small private operators that wish to shift towards cleaner and greener operations, Roadgas provides tailored solutions that are bespoke to individual businesses.

From the design and installation of CNG, LNG, LCNG and biomethane gas vehicle refuelling stations and dispense systems, to the build of high-pressure transport trailers and storage banks, Roadgas provides everything that is needed to deliver 'back to base' refuelling

at depot.

All infrastructure and equipment is manufactured in-house and with bespoke temporary solutions available for clients prior to the permanent installation of fuelling stations (as well as leasing options for those that wish to trial its products and services), and Roadgas is committed to making green fuels accessible to all.

David Rix, newly-appointed Managing Director of Roadgas has revealed: "We believe that fleets of all sizes should have access to biogas fuels, and with 'best fit' solutions that help organisations to take the right steps towards reducing harmful emissions and running costs, we ensure that small as well as large networks can enjoy cost effective, on-site access to greener options."

Paramount to the company's vision is to support its partners and clients with gas infrastructure installation to enable them to

enjoy the freedom to purchase biogas from any source. This allows clients to monitor availability, cost structure and therefore profitability.

Real time monitoring, 24/7 site support and integrated maintenance form part of its standard service, and working to ensure maximum up-time and optimal operational performance for all fleet operators lies at the core of its endeavours.

Collaborating with clients to understand their needs and challenges, and taking into consideration fleet size and type, location, gas availability and expansion plans, the Roadgas team combines expertise and resources to provide a truly turnkey service that is right for each individual client.

Trusted by Nottingham City Transport who looked to Roadgas to provide the infrastructure to fuel and maintain its present fleet of 53 double decker biogas buses, amongst many others, Roadgas

aims to become the renewable fuels infrastructure provider of choice in the UK and beyond.

With funding and subsidies currently available through the Office of Low Emission Vehicles (OLEV) – and through its support and advice that is backed by three decades of experience – Roadgas is set to play a significant role in the transition of other companies towards cleaner operations. With innovative technology that reduces CO2 output and fuel costs by potentially up to 30%, it remains focused on fuelling greener fleets for a greener future.

More information on Roadgas and an overview of its projects with Nottingham City Transport, Stagecoach North East, Veolia Sheffield and Leeds City Council amongst others, can be found at www.roadgas.co.uk.
